The target is: How to calculate the effective rate of interest based on the following two concepts:

- 1. The actual cost of debt (Paid to the bank)
- 2. The actual loan (Money) has been used (Utilized by the firm)

The actual cost of debt (paid) = Interest paid + Commencement fee

The actual cost of debt (paid) = Actual used loan (Utilized money) x Effective Interest rate x  $\frac{Period(M)}{365}$ 

While:

M =The time period on which we apply the rate (As used to calculate the interest per days)

By solving these two equations together:

 $Interest\ paid\ +\ Commencement\ fee = Actual\ used\ loan\ (Utilized\ money)\ x\ Effective\ Interest\ rate\ x\ \frac{Period\ (M)}{365}$ 

 $Interest\ paid\ + Commencement\ fee = \frac{(Loan\ Amount\ - \ Compensating\ Balance)\ x\ Effective\ Interest\ rate\ x\ M}{365}$ 

(Interest paid + Commencement fee )  $\times$  365 = (Loan - Compensating Balance)  $\times$  Effective Interest rate  $\times$  M By solving this equation:

Effective Interest rate = 
$$\frac{\text{(Interest paid + Commencement fee)} \times 365}{\text{(Loan - Compensating Balance)} \times M}$$

$$\label{eq:effective Interest rat} \begin{aligned} & \text{Effective Interest rat} = \frac{\text{(Interest paid + Commencement fee)}}{\text{(Loan - Compensating Balance)}} \times \frac{365}{\text{M}} \end{aligned}$$
